NAME: RANA BHAVYARAJSINH

STREAM: CSE

SUBJECT: INTERNSHIP – FUTURE INTERNS

DOMAINL: ML

TASK:-1

Task-1:

Sales & Demand Forecasting for Businesses

Libraries used:

Pandas: data manipulation

Matplotlib: for visuals and plotting graph

Sklearn: to perform regression to predict values

Software used:

Jupyter Notebook

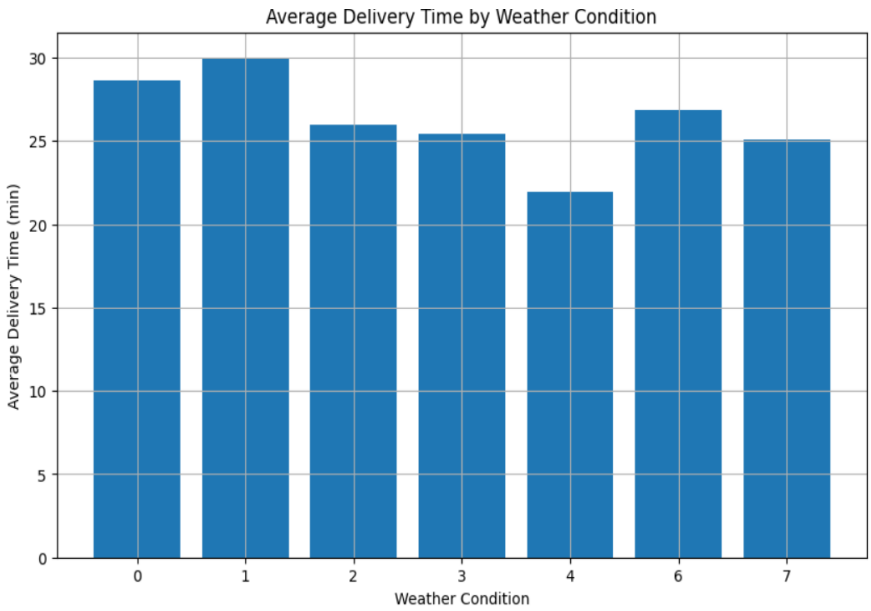
In this task I used 2 datasets attached along with this folder namely “updated.csv” and “Online Sales Data.csv” which was download from Kaggle.

Updated.csv:

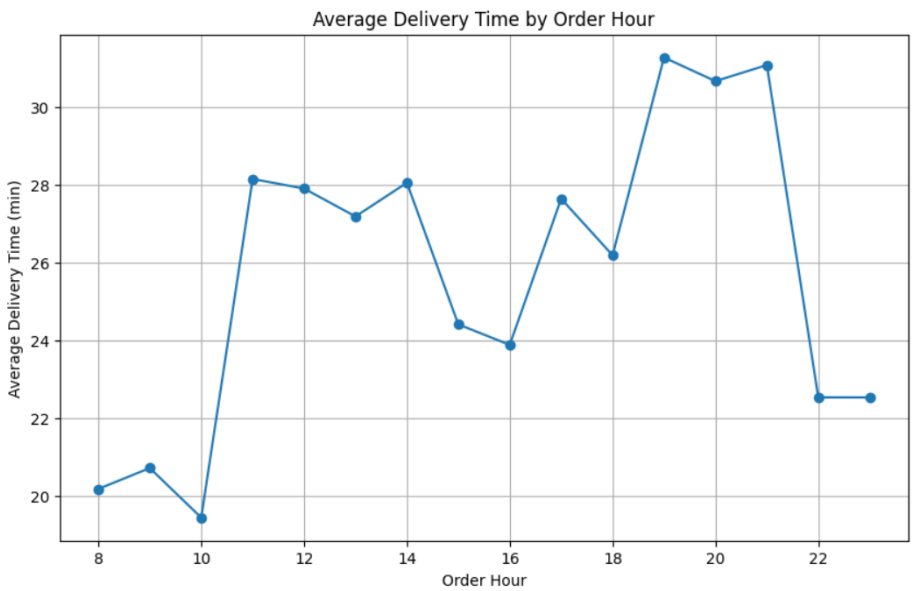
I used this dataset because it had more values than second dataset which is helpful in doing business analysis.

The dataset “updated.csv” is about delivering things like food from different restaurants which had fields like weather, time ordered, time order was received etc.

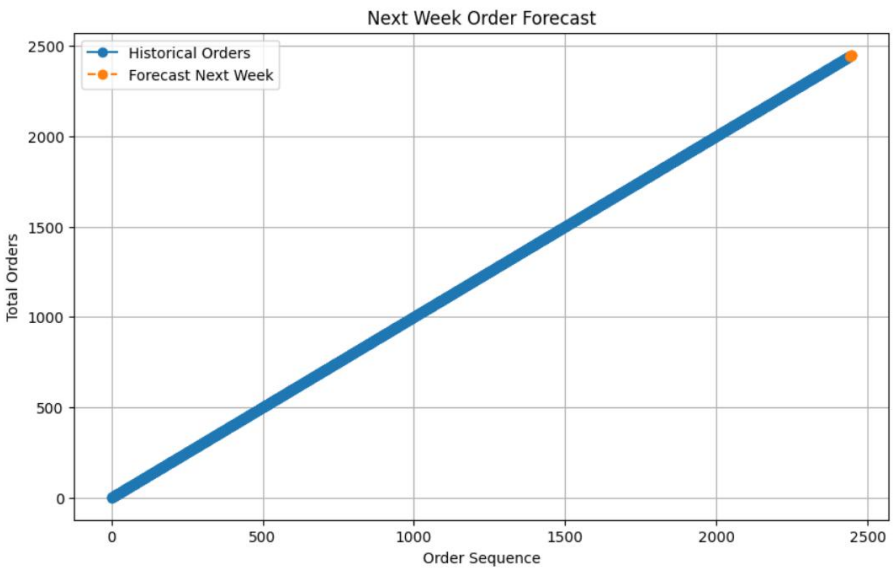
I used my business analysis skill to not only forecast the sales but also to determine the effects of weather condition in sales which will be shown in the task1.ipynb files that I attached in this folder.



I also tracked the average delivery time by hour in this file taken by delivery guys to deliver the order.



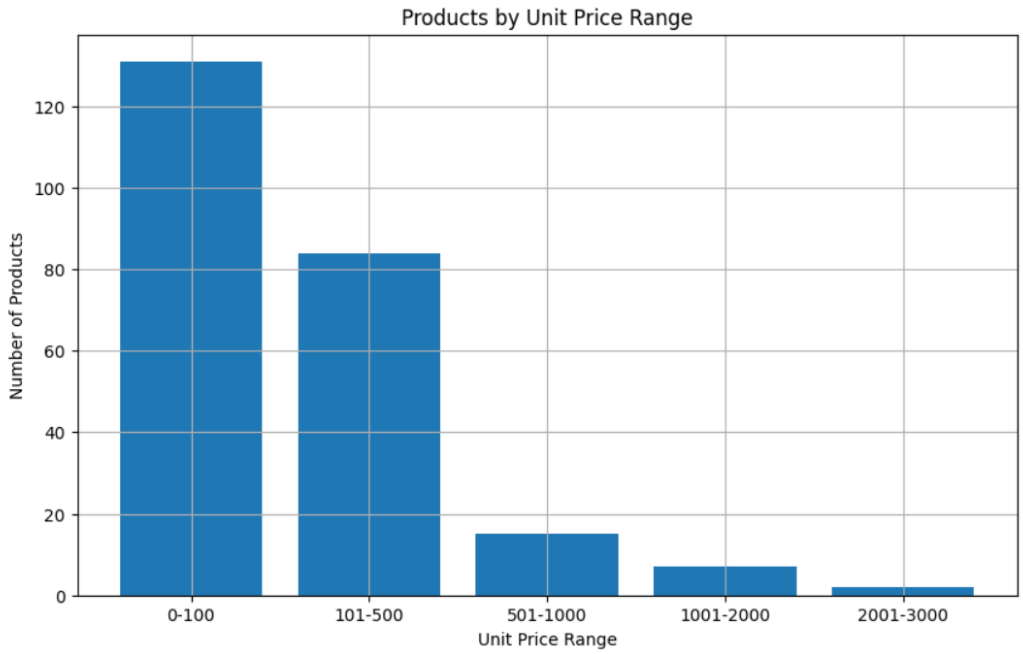
I used mathematical formula regression of probability and statistics to predict next week's order by whole of the dataset. It is performer in the file



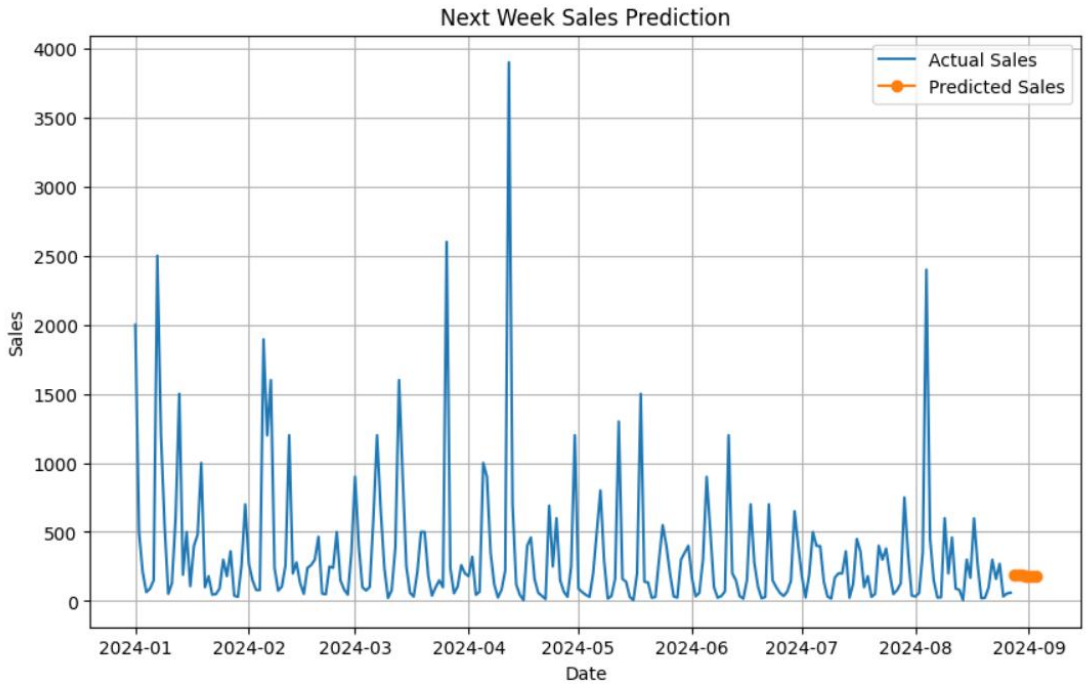
Online Sales Data.csv:

I used second data set to perform operation like classification and prediction , it had less values and more things to categorize. This data set is used in file task1.2ipynb.

I created bar graph to classify price with number of products.



I calculated the sum of products with their categories which can be useful businesses to determine the market.

```
Product Category
Electronics        40
Home Appliances    40
Clothing           40
Books              40
Beauty Products    40
Sports             40
Name: count, dtype: int64
```


I predicted the next objective sales using active sales which is present in this file along with date.
